Wearable AI

Is Wearable AI the next big thing or the dawn of a post-smartphone era?

1 Subtitle

Is Wearable AI the Next Big Thing or Just Another Hype?

As wearable AI technology advances, we're at a crossroads: is this the next major leap in our tech evolution, or just another fleeting fad? With glasses, trackers, and smart watches leading the charge, the potential for a post-smartphone era is becoming more tangible. These innovations, powered by AI and new interface technologies like voice and eye tracking, promise to redefine how we interact with the world around us.

Category Home Comments Highlights

However, devices like the Rabbit R1 have shown promise and generated excitement. By combining a Large Language Model with a "Large Action Model", the device can not only understand requests, but execute them. For example, in addition to providing suggestions for a healthy dinner, Rabbit can reportedly place an order with a local restaurant, or purchase ingredients for delivery.

The Large Action Model works almost similarly to an LLM, but rather than learning from datasets of words, it's learning from actions humans can take on websites and apps — such as ordering food, booking a travel or even super complex processes," says one reviewer. He explains that the Rabbit R1 isn't trying to replace the smartphone. However, he notes that he "wouldn't be surprised if it becomes a handoff solution. This is a breakthrough product that I never knew I needed until held one in my hands."
